

Simplest Surgery

Minimally Invasive Surgery

The Sophono implant system is the simplest and most stable option available. No other implant system - abutment or magnetic, offers the simplicity and impact resistance of the Sophono device. Review the surgical considerations with your ENT partner today and decide what option is best for your patients.

Lowest Profile

Just 2.6 mm height

Our implant is just 2.6 mm high and by design follows the contour of the bone. This placement avoids the everyday risks often associated with bone conduction devices. The Sophono system is a hearing solution for living and a secure implant for life. The osseointegrated implant is by far the safest with impacts - offering a more active lifestyle. Designed as a transcutaneous system, the Sophono ensures unparalleled low risk of skin issues, liberating Sophono patients to simply live life.

3 Tesla MRI and the smallest shadow

Sophono patients enjoy the security of the full range of MRI scans – up to 3 Tesla. MRI Techs like the small shadow on the scans, enabling more accuracy without the distortions or limits that competing systems present.

Every day more and more doctors and patients are choosing transcutaneous magnetics over abutments.

The magnetic future has arrived.

Don't take our word for it. Have your patients trial the Sophono product alongside other bone conduction systems you may offer. You'll be glad you did.
